f.

## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claim 1-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Meyer et al (hereinafter Meyer) U.S. Patent No. 6,289,378 in view of Dillingham U.S. Patent No. 6,327,608, and further in view of Deen et al., (hereinafter Deen) U.S. Patent No. 6,351,748.
- 2. In reference to claims 1 and 12, Meyer discloses a method for manipulating objects by using Internet protocol that allows a user to perform remote web content authoring operations, the method comprising: receiving a request using the protocol for a manipulation of a first network object from a requesting user, wherein the first network object includes at least one from the groups consisting of:

devices, resources and container objects (abstract, figures 1, 3A Item 305, col. 3 lines 26-col. 4 lines 21);

verifying a first set of authorization information (Figure 3A Item 310);

Art Unit: 2155

checking a file system for validity and authorization for the requesting user (Figure 3A Item 340); verifying a username and a password for the requesting user (Figure 3A Item 342);

determining an object type for the first network object (Figure 3A Items 382-384); and sending a response to the requesting user (Figure 3B Item 390).

Meyer. discloses the HTTP Response but does not disclose the translation from logical to physical location. However, Dillingham disclose steps of translating a logical object address to a physical file system path (Col. 8 lines 33-55); and checking a file system for validity and authorization for the requesting user including determining whether the first network object is a network object (Figure 4 Item 220). It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as disclosed by Meyer to include the translation as disclosed by Dillingham because the translation system will eliminate the need for the remote administrator to remember the entire path and exact name of the file on the server (Col. 1 lines 54-67). Furthermore, Dillingham teaches that this translation system prevents the inability to browse the server's physical files and directories from a remote computer over the Internet.

Furthermore, Meyer discloses checking a file system for validity and authorization for the requesting user. Meyer does not expressly include determining whether the first network object is a network object. However, this feature is deemed to be obvious from the Meyer system as Col. 5 lines 20-32 teaches that the administration can browse and select a number of network objects and its respective identification information.

Art Unit: 2155

Therefore, the object must be verified to determine whether the requested/selected object is that first object before identification information is displayed.

Meyer and Dillingham do not explicitly teach the using the Internet authoring, collaboration and versioning protocol. Deen teaches the step of using the Internet authoring, collaborating and versioning protocol (abstract, col. 1 lines 58-col. 2 lines 24. It would have been obvious to one of ordinary skill in the Data Processing art at the time of the invention to combine the teachings of Meyer, Dillingham and Deen to have the step of using the Internet authoring, collaborating and versioning protocol because it would have an efficient communications system which allows users to collaboratively edit, manage and authorize web content or files on remote web servers.

3. In reference to claim 23, Meyer discloses a system for manipulating network objects by using protocol that allows a user to perform remote web content authoring operations, the system comprising:

a web server (Figure 1 Item 116); a work station connected to the web server by an Internet connection (Figure 1 Items 102-108);

at least one network server connected to the web server (Col. 3 lines 40-45);
at least one storage system connected to the web server (Figure 1 Item 112);
means for receiving a request using the protocol for a manipulation of a first network
object from the work station, wherein the first network object includes at least one from

Art Unit: 2155

the group consisting of devices, resources and container objects (abstract, figures 1, 3A Item 305, col. 3 lines 25-col. 4 lines 21);

means for verifying a first set of authorization information (Figure 3A Item 310); means for checking for validity and authorization for a requesting user (Figure 3A Item 340);

means for verifying a username and a password for the requesting user (Figure 3A Item 342);

means for determining an object type for the first network object (Figure 3A Item 382 and 384); and

means for sending a response to the requesting user (Figure 3B Item 390).

Meyer discloses the HTTP Response but does not disclose the means for translating a logical Uniform Resource Locator to the storage system. However, Dillingham disclose steps of translating logical Uniform Resource Locator to the storage system (Col. 8 lines 33-55); and checking a file system for validity and authorization for the requesting user including determining whether the first network object is a network object (Figure 4 Item 220). It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as disclosed by Meyer to include the translation as disclosed by Dillingham because the translation system will eliminate the need for the remote administrator to remember the entire path and exact name of the file on the server (Col. 1 lines 54-67). Furthermore, Dillingham teaches that this translation system prevents the inability to browse the server's physical files and directories from a remote computer over the Internet.

Art Unit: 2155

Furthermore, Meyer discloses checking a file system for validity and authorization for the requesting user. Meyer does not expressly include determining whether the first network object is a network object. However, this feature is deemed to be obvious from the Meyer system as Col. 5 lines 20-32 teaches that the administration can browse and select a number of network objects and its respective identification information.

Therefore, the object must be verified to determine whether the requested/selected object is that first object before identification information is displayed.

Meyer and Dillingham do not explicitly teach the using the Internet authoring, collaboration and versioning protocol. Deen teaches the step of using the Internet authoring, collaborating and versioning protocol (abstract, col. 1 lines 58-col. 2 lines 24. It would have been obvious to one of ordinary skill in the Data Processing art at the time of the invention to combine the teachings of Meyer, Dillingham and Deen to have the step of using the Internet authoring, collaborating and versioning protocol because it would have an efficient communications system which allows users to collaboratively edit, manage and authorize web content or files on remote web servers.

4. In reference to claim 34, Meyer discloses a method for manipulating network objects by using Internet authoring, collaboration and versioning protocol, wherein the protocol allows a user to perform remote web content authoring operations, the method comprising:

receiving a request using the protocol for a manipulation of a first network object from a requesting user (abstract, figures 1, 3A Item 305, col. 3 lines 25-col. 4 lines 21);

Art Unit: 2155

verifying a first set of authorization information (Figure 3A Item 310);

checking a file system for validity and authorization for the requesting user, wherein the first network object includes at least one from the group consisting of: devices, resources and container objects (Figure 3A Item 340);

verifying a username and a password for the requesting user (Figure 3A Item 342); returning a first error message if requesting user is unauthorized to access the first network object (Figure 3A Item 346);

determining an object type for the first network object (Figure 3A Item 382 and 384); sending a response to the requesting user (Figure 3B Item 390);

navigating a context menu for a plurality of screens that allow modification of the set of attributes of the first network object (Figure 5 and 6); and

modifying a set of attributes of the first network object by modifying a set of fields on a screen of a subset of the set of attributes (Figure 6 and 7).

Meyer discloses the HTTP Response but does not disclose the means for translating a logical object address to a physical file system path. However, Dillingham disclose steps of translating logical object address to a physical file system path (Col. 8 lines 33-55); and checking a file system for validity and authorization for the requesting user including determining whether the first network object is a network object (Figure 4 Item 220). It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as disclosed by Meyer to include the translation as disclosed by Dillingham because the translation system will eliminate the need for the remote administrator to remember the entire path and exact name of the

Art Unit: 2155

file on the server (Col. 1 lines 54-67). Furthermore, Dillingham teaches that this translation system prevents the inability to browse the server's physical files and directories from a remote computer over the Internet.

Furthermore, Meyer discloses checking a file system for validity and authorization for the requesting user. Meyer does not expressly include determining whether the first network object is a network object. However, this feature is deemed to be inherent from the Meyer system as Col. 5 lines 20-32 teaches that the administration can browse and select a number of network objects and its respective identification information.

Therefore, the object must be verified to determine whether the requested/selected object is that first object before identification information is displayed.

Meyer and Dillingham do not explicitly teach the using the Internet authoring, collaboration and versioning protocol. Deen teaches the step of using the Internet authoring, collaborating and versioning protocol (abstract, col. 1 lines 58-col. 2 lines 24. It would have been obvious to one of ordinary skill in the Data Processing art at the time of the invention to combine the teachings of Meyer, Dillingham and Deen to have the step of using the Internet authoring, collaborating and versioning protocol because it would have an efficient communications system which allows users to collaboratively edit, manage and authorize web content or files on remote web servers.

5. In reference to claim 40, Meyer discloses a computer network for a plurality of users to access a workplace by using Internet authoring, collaboration and versioning

Art Unit: 2155

protocol, wherein the protocol allows user to perform remote web content authoring

operations, the system comprising:

a plurality of network computer servers within the computer network (Col. 3 lines 40-

45);

a plurality of network computer workstations within the computer network and connected to at least one of the plurality of network computer servers (Figure 1 Items 102 -108);

a file system, network directory, and printing subsystem on the computer network and accessible by the plurality of users by the protocol (Figure 2 Item 215);

a security system that provides an authentication process in order to allow access to the plurality of users to the file system, network directory, and printing subsystem (Figure 3A); and

a graphical user interface using the protocol for viewing the file system, network directory and printing subsystem as the workplace, and providing the plurality of users the ability to manipulate the file system, network directory and printing subsystem and the ability to run a plurality of network applications within the file system and network directory portions of the subsystem (Abstract and Figure 5).

Meyer and Dillingham do not explicitly teach the using the Internet authoring, collaboration and versioning protocol. Deen teaches the step of using the Internet authoring, collaborating and versioning protocol (abstract, col. 1 lines 58-col. 2 lines 24. It would have been obvious to one of ordinary skill in the Data Processing art at the time of the invention to combine the teachings of Meyer, Dillingham and Deen to have the

Art Unit: 2155

step of using the Internet authoring, collaborating and versioning protocol because it would have an efficient communications system which allows users to collaboratively edit, manage and authorize web content or files on remote web servers.

- 6. In reference to claim 2, 22, and 33, Meyer and Dillingham together disclose method of claim 1, 12, and 23. Further Meyer discloses wherein the manipulation of the first network object includes changing a set of attributes of the first network object (Col. 6 lines 1-22).
- 7. In reference to claim 3, 13, and 24, Meyer and Dillingham together disclose the method of claim 1, 12 and 23. Meyer does not disclose verifying that the first object is found. However, Dillingham discloses a step of verifying that the first network object is found (Col. 5 lines 51-55 and Figure 3 Item 112-114 and Figure 4 Item 220-222). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as disclosed by Meyer to include the verification because proper error trapping offers an extra layer of verification thereby resulting in a more efficient and robust system.
- 8. In reference to claim 4, 14, and 25, Meyer and Dillingham together disclose the method of claim 3, 13, 24. Meyer does not disclose the step of returning a second error message if the first network object is not found. However, Dillingham discloses the step of returning a second error message if the first network object is not found.

Art Unit: 2155

(Col. 7 lines 59-65 and Figure 4 Item 220-222). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as disclosed by Meyer to include the second error message because proper error trapping offers an extra layer of verification. More importantly, the error message provides informational feedback for the user.

- 9. In reference to claim 10, 20, and 31, Meyer and Dillingham together disclose the method of claim 1, 12, and 23. Meyer further includes modifying a set of attributes of the first network object by modifying a set of fields on a screen of a subset of the set of attributes (Figure Col. 6 lines 20-59 and Figure 6).
- 10. In reference to claim 11, 21 and 33, Meyer and Dillingham together disclose the method of claim 10, 20, and 31. Meyer further includes navigating a context menu for a plurality of screens that allow modification of the set of attributes of the first network object (Figure 5).
- 11. In reference to claim 41, Meyer discloses the computer network of claim 40 wherein the computer network is a global Internet network and the file and directory subsystem is within an intranet network (Figure 1).

Art Unit: 2155

- 12. In reference to claim 42, Meyer and Dillingham together disclose the computer network of claim 40. Meyer further teaches where the graphical user interface is a web browser (Abstract).
- 13. Claims 5-6, 15-16, 26-27, and 35-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Meyer, Dillingham and Deen as applied to claim 1, 12, 23, and 34 above, and further in view of Shrader et al. U.S. Patent No. 6,195,097.
- 14. In reference to claim 5, 15, 26, and 35, Meyer and Dillingham together disclose the method of claim 1, 12, 23, and 34. Meyer discloses a variety of activities performed through the web browser including file system browsing, process viewing and modifications of network objects (Col. 6 lines 1-22). Meyer and Dillingham both do not disclose assigning new rights to the first network object. However, Shrader et al. discloses a web-based distributed computing environment to administer and manage computer resources. Shrader et al. also disclose that network administrators can modify the security attributes, such as system privileges, of an object (Col. 4 lines 5-21). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as disclosed by Meyer and Dillingham to include the feature of assigning new rights to the first network object because assigning user's rights is a network administrative task similar to file system browsing and process viewing. The need for network administrator to configuring network objects easily, securely and quickly from a

**Art Unit: 2155** 

remote secure web browser is just as important as for an administrator to assign user's rights.

- 15. In reference to claim 6, 16, 27 and 36, Meyer and Dillingham together disclose the method of claim 5, 15, 26, and 35. Meyer and Dillingham do not disclose wherein the new rights for the first network object are for a second network object. However, it is obvious to one of ordinary skill in the art that two objects can have the same set of rights. Two objects can be configured with the same security privileges using the Shrader et al. system. Therefore, claim 6, 16, 27, and 36 are rejected until the same rationale as claims 5, 15, 26 and 35.
- 16. Claims 7-9, 17-19, 28-30, and 37-39 is rejected under 35 U.S.C. 103(a) as being unpatentable over Meyer and Dillingham, Deen and Shrader et al. as applied to claims 5, 7, 15, 17, 26, 27, 35, and 37 above and further in view of Smith II et al U.S. Patent No. 5,884,298.
- 17. In reference to claim 7, 17, 28, and 37, Meyer, Dillingham and Shrader et al. together discloses the method of claim 5, 15, 26, and 35. However, Meyer, Dillingham and Shrader et al. together does not disclose wherein the new rights are assigned by dragging and dropping a second network object on the first network object by the use of an interactive computer screen.

Art Unit: 2155

Official notice is taken that the drag and drop feature to assign the properties of one object to another is well known. Therefore, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to

- 18. In reference to claim 8, 18, 29, and 38, Meyer, Dillingham, and Shrader et al. together discloses the method of claim 7, 17, 27, and 37. However, Meyer, Dillingham, and Shrader et al. does not disclose wherein the new rights are all rights for all users and assigned by dragging a public icon and dropping the public icon on the first network object. Smith II et al. discloses the method of manipulating objects by dragging and dropping icons, icons being associated with the objects (Abstract). Smith II et al. also discloses a hierarchical index to a user with a private CD Exchanger and a Network Access CD Exchanger. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the system disclosed by Meyer, Dillingham, and Shrader et al. together to drag and drop the public icon on the first network object to assign users rights because the drag and drop feature is known in the art to associate properties with one another (Col. 20 lines 14-15).
- 19. In reference to claim 9, 19, 30, and 39, Meyer and Dillingham together disclose the method of claim 7, 17, 27, and 37. However, Meyer, Dillingham, and Shrader et al. does not disclose wherein the new rights are subtracting all rights for all users except an assigned user to the first network object and wherein the new rights are

one another (Col. 20 lines 14-15).

Art Unit: 2155

assigned by dragging a private icon and dropping the private icon on the first network object. Smith II et al. discloses the method of manipulating objects by dragging and dropping icons, icons being associated with the objects (Abstract). Smith II et al. also discloses a hierarchical index to a user with a private CD Exchanger and a Network Access CD Exchanger. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to

modify the system disclosed by Meyer, Dillingham, and Shrader et al. together to

because the drag and drop feature is known in the art to associate properties with

drag and drop the private icon on the first network object to assign users rights

20. Claims 12-21 and 23-32 have similar limitations as claims 1-11; therefore, they are rejected under the same rationale.

## Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ThuHa Nguyen whose telephone number is 703-305-7447. The examiner can normally be reached on Mon-Fri (8:30am-5:00pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz R. Sheikh can be reached on 703-305-9648. The fax phone numbers

Application/Control Number: 09/394,590 Page 16

Art Unit: 2155

for the organization where this application or proceeding is assigned are 703-305-7201 for regular communications and 703-305-7201 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.
